

KnowledgeDesk IT Support Runbook

Version 1.0 - Internal Knowledge Base

Overview

This runbook helps IT support agents answer common employee support questions. It covers account access, password resets, VPN troubleshooting, laptop replacement, software installation requests, and escalation rules. Use this document as trusted context when answering KnowledgeDesk RAG questions.

Password Reset Policy

Employees can reset their password from the account security portal. The user must complete multi-factor authentication. Temporary passwords expire after 30 minutes. Support agents must never ask users to share their current passwords.

VPN Troubleshooting

If the VPN client fails to connect, ask the user to confirm internet access, restart the VPN client, and verify that the VPN settings are correct. If the error code is MFA_TIMEOUT, retry login and approve MFA within 60 seconds. If the error code is CERT_EXPIRED, advise the user to contact their manager for a new certificate.

Laptop Replacement Workflow

A laptop replacement requires manager approval unless the device is fully unusable. For hardware failure, collect the broken laptop and create a replacement request. Standard replacement target is three business days after approval. For executives and customer-facing outages, expedite the process.

Software Installation Requests

Approved software can be installed from the company self-service portal. Restricted software requires security review. If a license is required, route the request to procurement after manager approval.

Escalation Rules

Escalate immediately if the issue affects more than 20 users, involves suspected data loss, blocks payroll, or impacts customer-facing services. Security incidents such as phishing, malware alerts, or account compromise must be routed to the security operations team.
